Categories of Practical Financial Management Questions

Understanding the different categories helps in targeted preparation. Here are the primary types:

1. Capital Budgeting and Investment Appraisal

These questions focus on evaluating investment projects through techniques like Net Present Value (NPV), Internal Rate of Return (IRR), Payback Period, and Profitability Index. They often involve calculating the viability of projects based on cash flows, discount rates, and risk factors.

Example:

Calculate the NPV of a project with an initial investment of \$100,000, expected cash inflows of \$30,000 annually for 5 years, and a discount rate of 10%.

2. Working Capital Management

Questions in this category assess understanding of managing short-term assets and liabilities. Topics include inventory management, receivables, payables, and cash management strategies.

Sample Question:

Determine the optimal level of inventory given the holding cost per unit, ordering cost, and annual demand.

3. Cost of Capital and Financing Decisions

These questions examine how firms determine their cost of debt and equity, weighted average cost of capital (WACC), and optimal capital structure.

Sample:

Calculate the WACC given the cost of debt, cost of equity, and respective weights.

4. Financial Ratio Analysis

Focuses on interpreting ratios such as liquidity ratios, profitability ratios, leverage ratios, and efficiency ratios to assess financial health.

Sample:

Interpret a company's current ratio of 1.5 and debt-equity ratio of 0.6.

5. Dividend Policy and Capital Structure

Questions explore the impact of dividend policies and capital structure choices on firm value and shareholder wealth.

Sample:

Discuss the implications of adopting a residual dividend policy.

Approach to Solving Lasher Practice Questions

Effective problem-solving in financial management requires a structured approach. Here are key steps:

1. Understand the Question Thoroughly

Read carefully to identify what is being asked. Highlight key data points such as cash flows, rates, time periods, and specific requirements.

2. Recall Relevant Concepts and Formulas

Match the problem with relevant formulas and concepts. For example, if calculating NPV, recall the formula:

$$NPV = \sum \left(\frac{\text{Cash inflows}}{(1 + r)^t} \right) - \text{Initial Investment}.$$

3. Organize Data Systematically

Create a table or schedule for cash flows, discount factors, or ratios. This organization minimizes errors and clarifies the calculation process.

4. Perform Calculations Carefully

Use appropriate tools and double-check calculations. Remember to consider the correct units, signs,

and assumptions.

5. Interpret Results Contextually

Beyond numerical answers, analyze what the results imply for decision-making. For instance, a positive NPV indicates profitability, but consider the project's risk profile.

6. Review and Cross-Verify

Always revisit your calculations and logic to ensure accuracy before finalizing your answer.

Sample Practice Questions with Detailed Explanations

To illustrate the application of these principles, consider the following sample questions:

Question 1: Capital Budgeting

A company is evaluating a project requiring an initial investment of \$200,000. The project is expected to generate cash inflows of \$50,000 annually for 6 years. The company's required rate of return is 12%. Should the project be accepted based on NPV?

Solution Approach:

- Calculate the present value of annuity of \$50,000 over 6 years at 12%.
- Use the Present Value of Annuity formula or table.
- Compute NPV: $NPV = PV \text{ of cash inflows} - \text{initial investment}$.

Calculation:

$PV \text{ of annuity} = \$50,000 \times \text{Annuity factor at 12\% for 6 years (approximately 4.1114)} = \$50,000 \times 4.1114 = \$205,570$.

$NPV = \$205,570 - \$200,000 = \$5,570$.

Decision:

Since NPV is positive (\$5,570), the project is financially viable and should be accepted.

Question 2: Working Capital Management

The company has an average inventory of \$150,000, with a cost of holding inventory at 20% annually, and an annual sales of \$1,200,000. Determine the inventory turnover ratio and interpret its meaning.

Solution Approach:

- Inventory turnover = Cost of Goods Sold / Average Inventory.
- Assuming COGS is 75% of sales (common in many industries): $\text{COGS} = 0.75 \times \$1,200,000 = \$900,000$.
- Inventory turnover = $\$900,000 / \$150,000 = 6$ times.

Interpretation:

An inventory turnover of 6 indicates the company sells and replaces its inventory six times a year, reflecting operational efficiency. Higher turnover suggests efficient inventory management, but too high can lead to stockouts.

Question 3: Cost of Capital

Calculate the Weighted Average Cost of Capital (WACC) given:

- Cost of debt (K_d) = 8%,
- Cost of equity (K_e) = 14%,
- Market value of debt = \$500,000,
- Market value of equity = \$1,000,000,
- Tax rate = 30%.

Solution:

- $\text{WACC} = (E/V) \times K_e + (D/V) \times K_d \times (1 - \text{Tax rate})$,
- $E = \$1,000,000$, $D = \$500,000$, $V = \$1,500,000$.

Calculations:

$$E/V = 1,000,000 / 1,500,000 = 0.6667$$

$$D/V = 500,000 / 1,500,000 = 0.3333$$

$$WACC = (0.6667 \times 14\%) + (0.3333 \times 8\% \times 0.7)$$

$$= 0.6667 \times 0.14 + 0.3333 \times 0.08 \times 0.7$$

$$= 0.0933 + 0.0187 = 0.112 \text{ or } 11.2\%$$

Implication:

The company's cost of capital is approximately 11.2%, which serves as the hurdle rate for investment decisions.
